

Assignment 2

Q1. Write a Python program that takes two lists as input and:

- Converts them into sets.
- Computes and displays the union, intersection, and difference of these sets.
- Checks if one set is a subset or superset of the other.
- Finds the symmetric difference of the two sets.
- Output the results in a sorted manner.

Q2. Write a Python program that:

- Takes a list of integers (with possible duplicates) as input.
- Converts the list into a set to remove duplicates and prints the resulting set.
- Convert the set back into a sorted list and display the sorted list.

Q3. Write a Python program that:

- Takes a list of strings as input (some strings may repeat).
- Creates a set from the list to remove duplicates.
- Then, for each unique string, counts its occurrences in the original list and displays the count.

Q4. Write a Python function that accepts two list with integer elements. Now design function code to perform union between these two lists and store the result in third list and print .
